Artificial neural networks are capable of recognizing images. From over 10 million photos, Google's neural network learns to recognize a cat's image.

In 1997, for the first time a computer beats the best of humans in a discipline. Deep Blue defeats Garry Kasparov at chess.

Machine learning: machines learn from interacting with our answers. Amazon's personal virtual assistant, Alexa, appears in 2014.

Deep learning: algorithms teach themselves complex tasks and they respond precisely and profoundly. AlphaZero only needs 4 hours to learn how to play Go in 2018.

Artificial intelligence enables automation of large-scale production tasks, gets close to human behaviors and predicts alternative outcomes. Machines become... creative?

Artistic cooperation between humans and algorithms. Customization of prescription through labeling and cataloging processes. Spotify preference profiles and recommendations from Netflix or HBO.

Artificial neural networks are capable of learning and recognition actions in response to external stimuli, simulating the functioning of a human brain.

Collaborative logic between humans and algorithms. Customization of prescription through labeling and cataloging processes. Spotify preference profiles and recommendations from Netflix or HBO.

Artificial neural networks are capable of recognizing images. From over 10 million photos, Google's neural network learns to recognize a cat’s image.
